# Hunter Abshire

Lexington, KY • (502) 554-1822 • hunterkabshire@gmail.com • github.com/Hunter-Abshire • LinkedIn

AWS Certified: Security – Specialty • Solutions Architect – Professional • Developer, SysOps Administrator – Associate

## SUMMARY

Platform engineer operating 15+ backend services across a **68-account AWS organization** for a payments platform processing **$23B+ annually at 99.99%+ uptime**. Led an organization-wide TLS remediation, rebuilt BlockChyp's deployment platform on ECS Fargate and CodeDeploy blue/green, and migrated 3 GitHub organizations into GitHub Enterprise. AWS CDK (TypeScript), Terraform, GitHub Actions, Python, Datadog, Kubernetes.

## WORK EXPERIENCE

**Software Engineer, Platform & Infrastructure** March 2025 – Present

*Stax Payments*

- Rebuilt BlockChyp's payment-gateway deployment platform: migrated Troposphere-generated CloudFormation to **AWS CDK**, moved ECS from EC2 to Fargate, and replaced a deploy model that created and destroyed services on every release with **ECS CodeDeploy blue/green** and automated rollback; ran the April 2026 production cutover with zero customer-facing incidents.
- Core engineer migrating **3 GitHub organizations into one GitHub Enterprise tenant** (10 orgs, 23 teams, 7 tranches): owned secrets and AWS OIDC trust across 22 accounts, hardened the tenant with no-bypass rulesets, and cut the secret-scanning backlog from **250 alerts to 24**.
- Led an organization-wide TLS remediation across **100+ API Gateway REST endpoints and ~30 custom domains in 68 AWS accounts**, migrating TLS 1.0/1.1 to 1.2+; phased the rollout by environment and coordinated cutover with 4 service-owning teams in **2 weeks with zero production incidents**.
- Own the secure file-exchange system for card token import/export with external processors: **AWS Transfer Family** SFTP in Terraform behind AWS Verified Access, plus a self-service credential app on ECS Fargate and 11 TypeScript Lambdas that returns passwords **PGP-encrypted to the recipient's key**; replaced a 30-minute manual workflow, 15 processor organizations onboarded.
- Designed an organization-wide security alerting pipeline streaming GuardDuty findings from **all 68 AWS accounts** into Datadog using CDK, EventBridge, and Lambda, **replacing weekly manual review with real-time detection**; authored the Datadog monitors and runbooks now used in on-call incident response.
- Support PCI-DSS and SOC 2 audits with external assessors (Moss Adams) across **three audit cycles**: enabled audit logging on every production database into Splunk, enforced EBS and SSM public-access blocks org-wide with AWS Config auto-remediation, and audited security groups and IAM user access.

**Software Engineer Intern** May 2024 – August 2024

*Chick-fil-A Inc.*

- Built a conversational AI assistant on Slack for a 4,000-member workspace that **reduced help-channel load by 50%**, powered by Amazon Kendra, S3, API Gateway, CloudWatch, Lambda, Python, and Vertex AI.
- Developed a Backstage plugin using React to display AWS financial data via RESTful APIs.

## SKILLS

**Languages:** Python, TypeScript, SQL, Java, Go

**Technologies:** AWS, CDK/CloudFormation, Terraform, GitHub Actions, Datadog, Kubernetes, Docker, Linux, MySQL

**Frameworks:** React, Node, Express

## EDUCATION

**Georgia Institute of Technology** – M.S. Computer Science – *4.0/4.0 GPA* August 2025 – May 2028

**University of Kentucky** – B.S. Computer Engineering, B.S. Computer Science – *3.89/4.0 GPA* May 2025
